

Person Verification Service Enhanced

Verify consumer identity accurately in real-time.

A real-time person verification tool enables the positive and accurate identification of an individual when face-to-face verification is not possible, using their credit and personal information stored on the Experian Bureau Database.

- Person Verification Service Enhanced (PVS-E) was designed to confirm consumer identities in a world where personal information is constantly changing.
- To confirm identity, PVS-E uses various components of an individual's personal and credit information from the bureau.
- In addition to minimising risk and fraud, PVS-E can be used to streamline internal processes.
- PVS-E is unique in that it allows customisable rules suited to your company and to manage the risks associated with phishing attacks and illegal attempts to access personal information.

How it works

- PVS-E utilises relevant personal and credit information of a consumer to derive between 3 and 5 multiple choice security questions that are asked of individual.
- Answers are collated and measured against a % accuracy threshold, as set by the Experian subscriber, thus providing a view on the probability of the individual being who they say they are.
- A variety of data sources are interrogated to formulate the questions, including, Deeds Data, Address Information, Credit Accounts Data, Employment Information, Contact Information, Judgment Data, Principal (CIPC) Data, Debt Counselling Data and SAFPS Data.

5 Reasons to make use of Person Verification Service Enhanced

- Set answer accuracy threshold
- Seamless integration with any platform
- Randomised questions for all transactions
- Improve and streamline your verification process
- Easy-to-use and convenient
